Introduction:

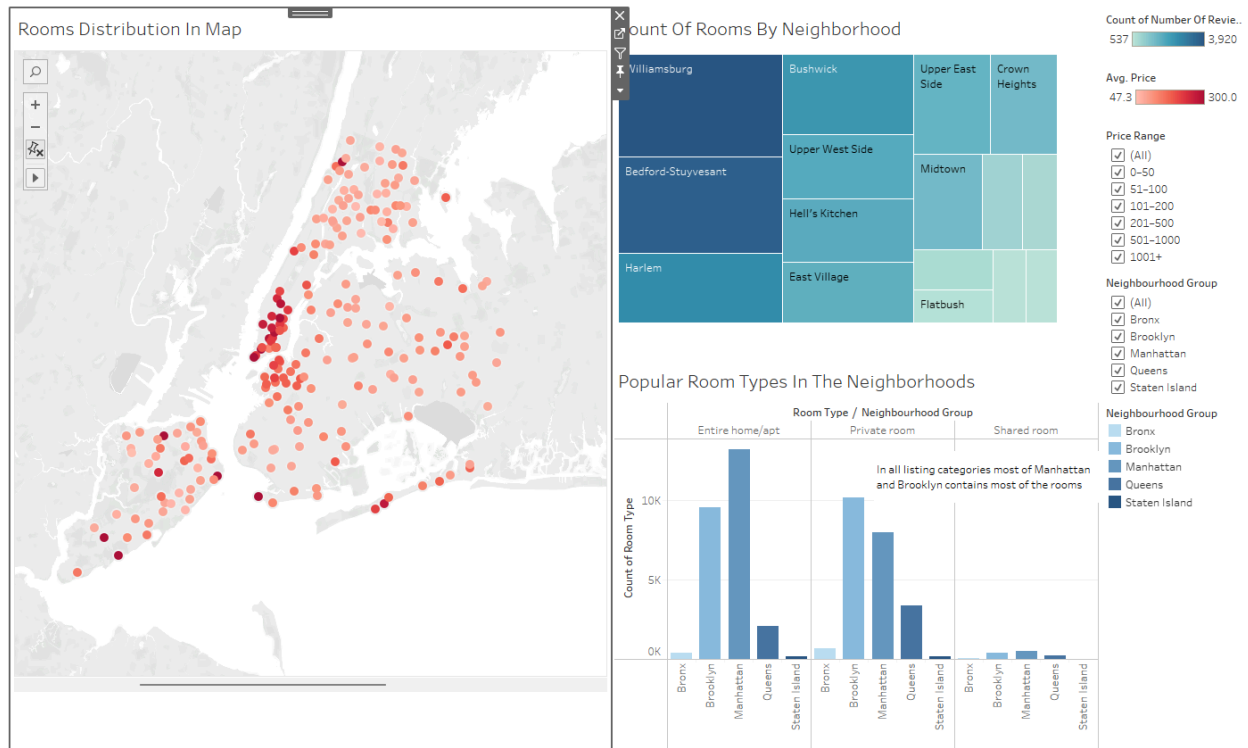

In this task we used tableau to analyse insights about Airbnb dataset about some rooms and hotels.

In first dashboard we explore geographical data and it's relationship with price and popularity.

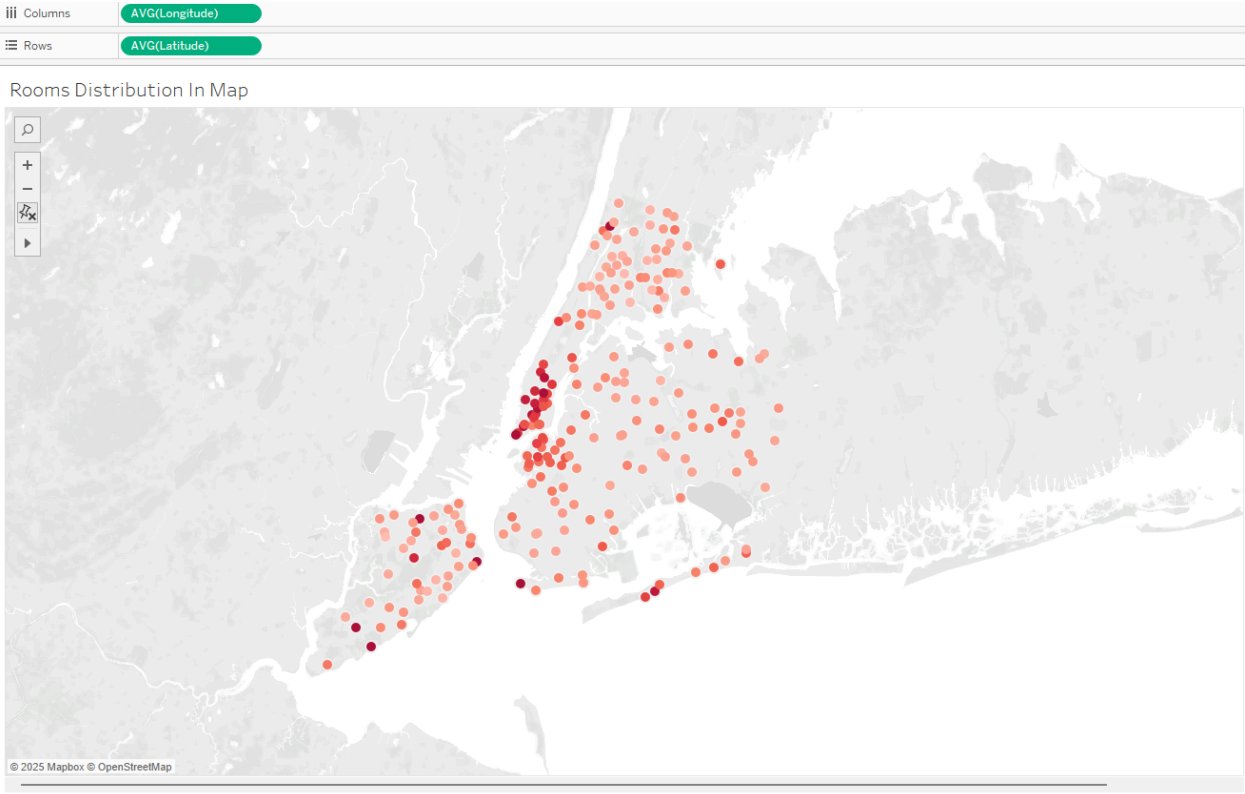

The second dashboard is designed about analysis of price and it's relationship with other parameters.

The third dashboard is about reviews. We visualized some correlations between how many people review and the features of the accomodations.

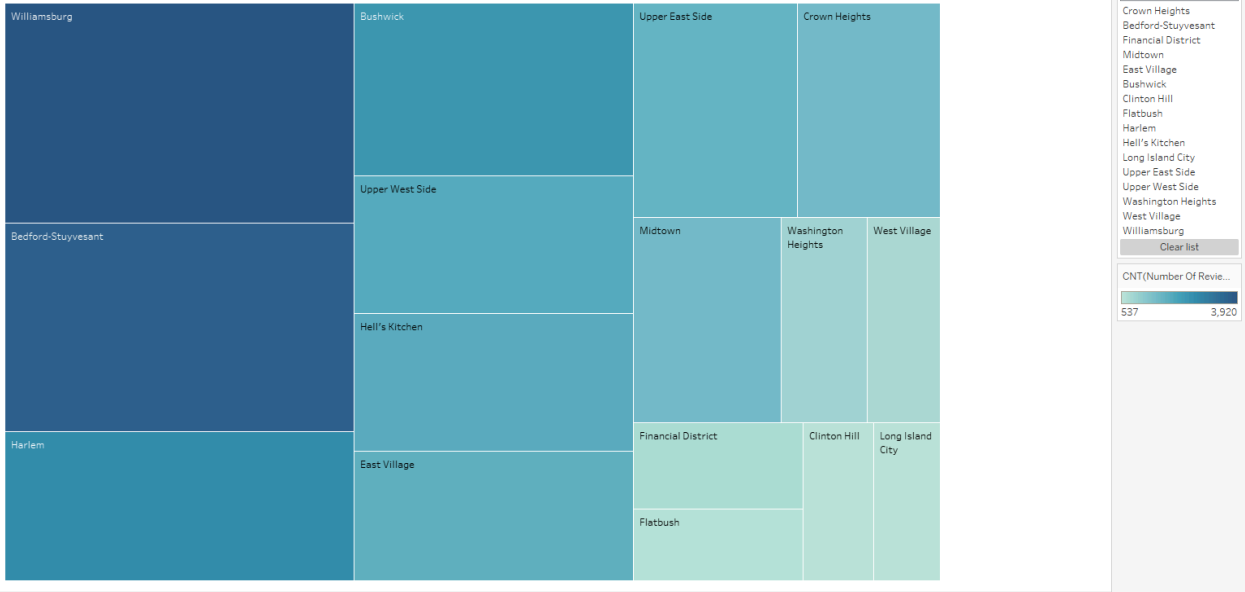

Dashboard 1 :

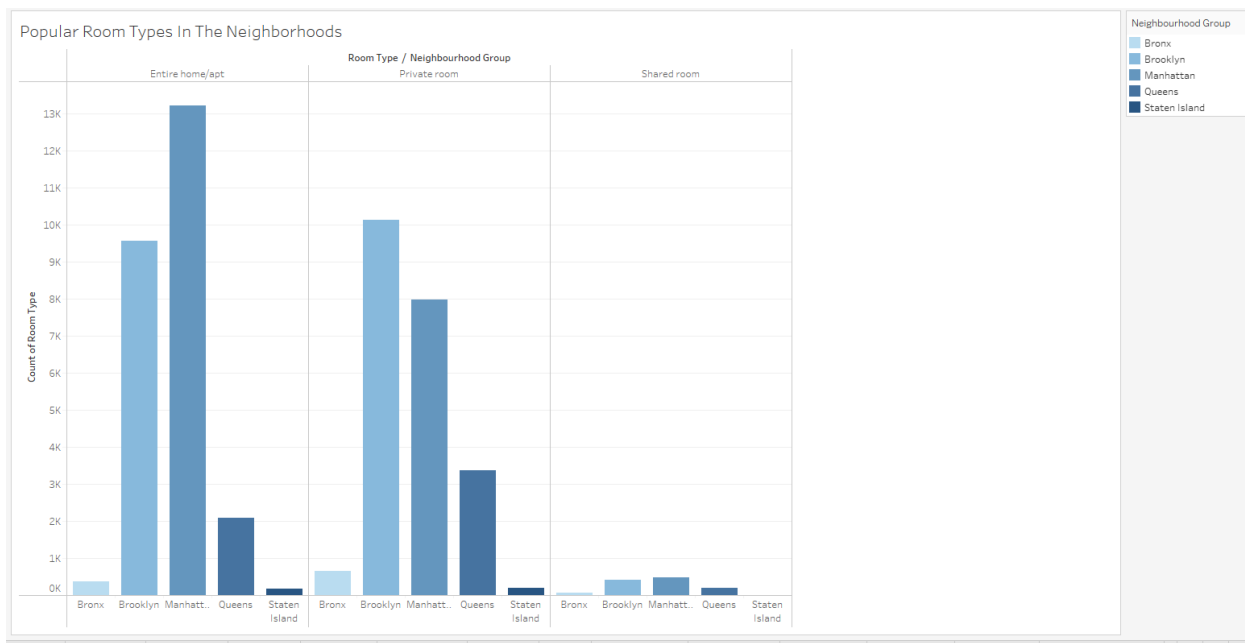

Worksheets:

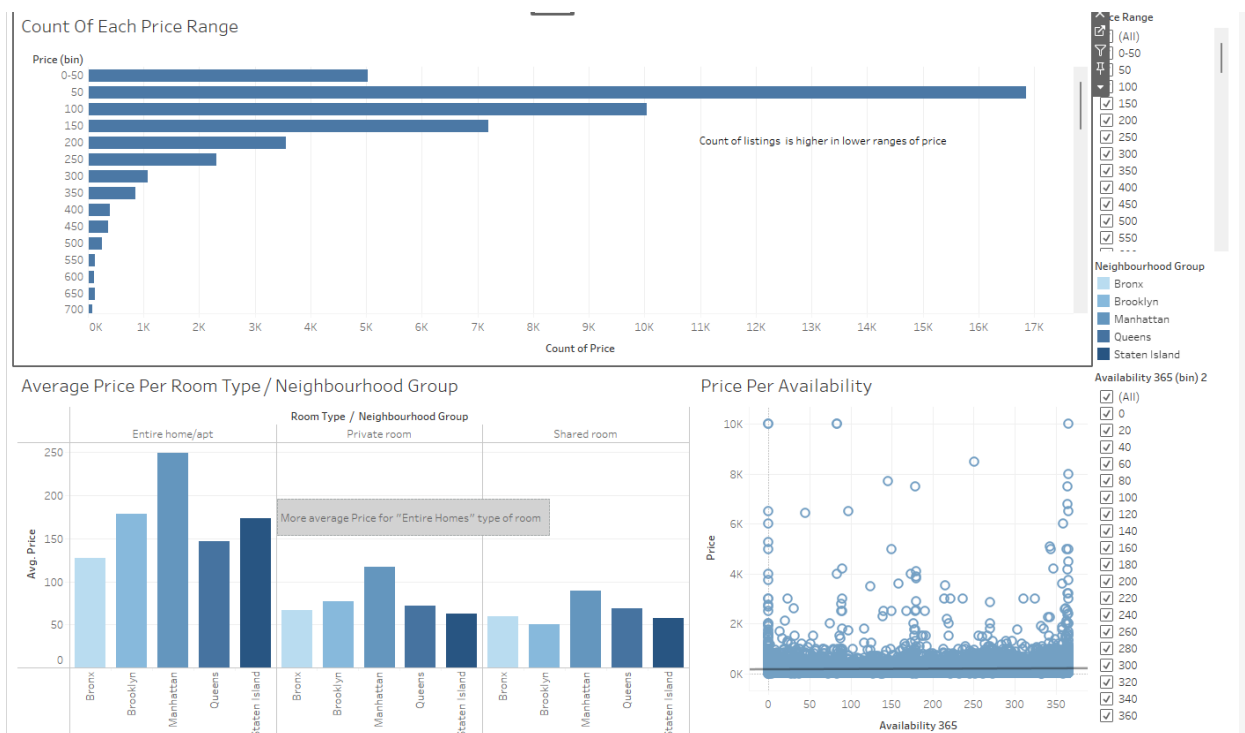

Count Of Rooms By Neighborhood

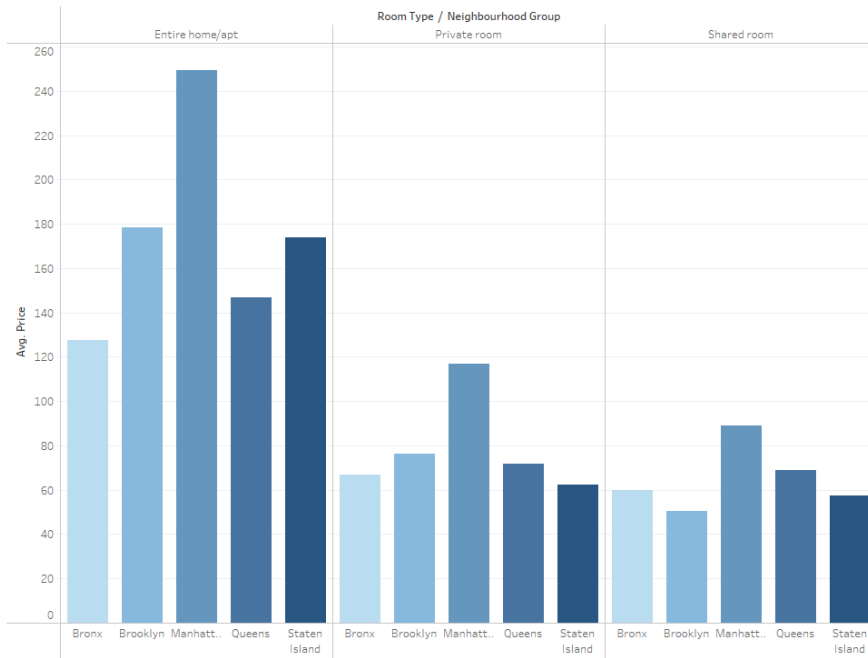

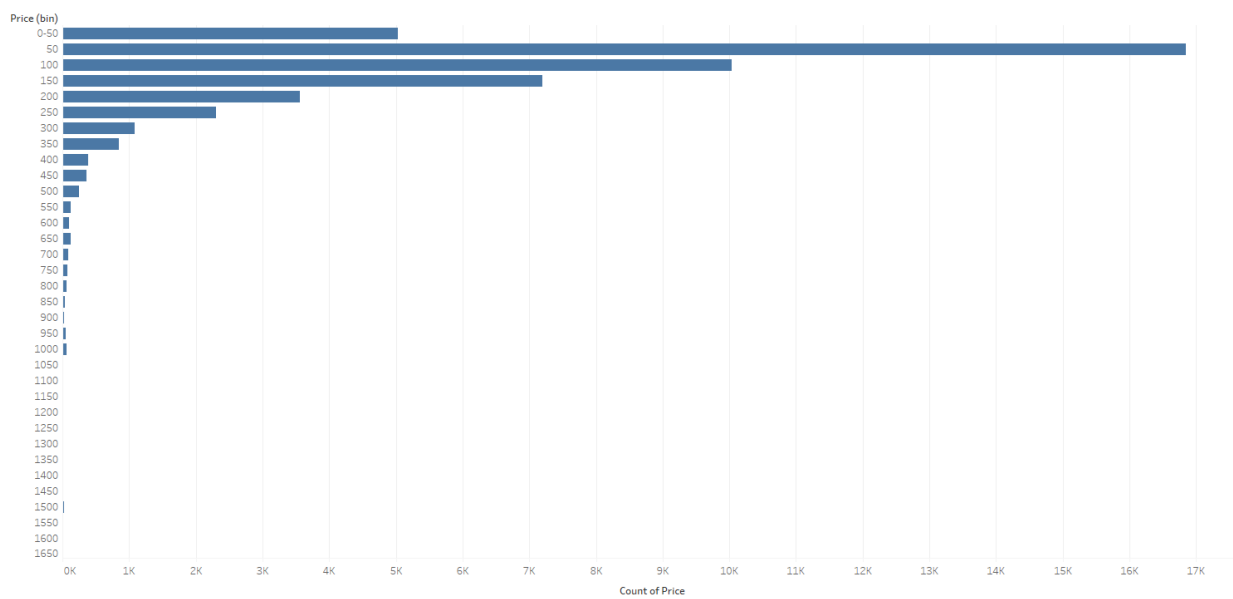

Dashboard 2:

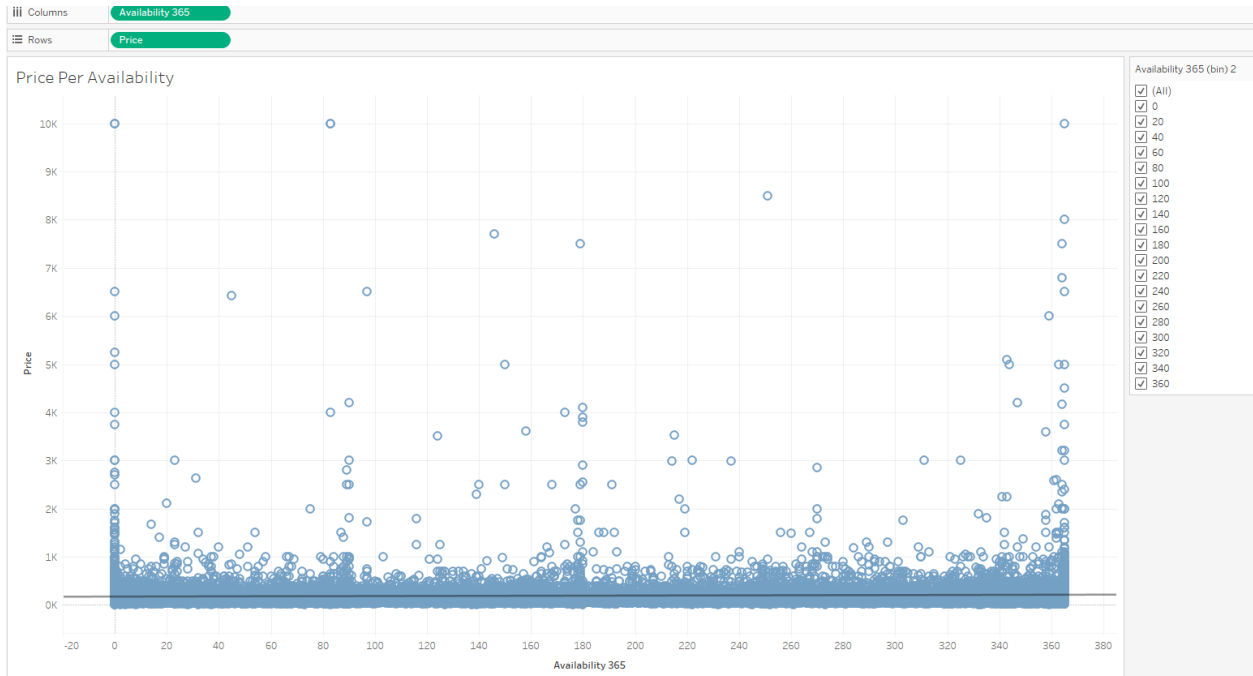

Average Price Per Room Type / Neighbourhood Group

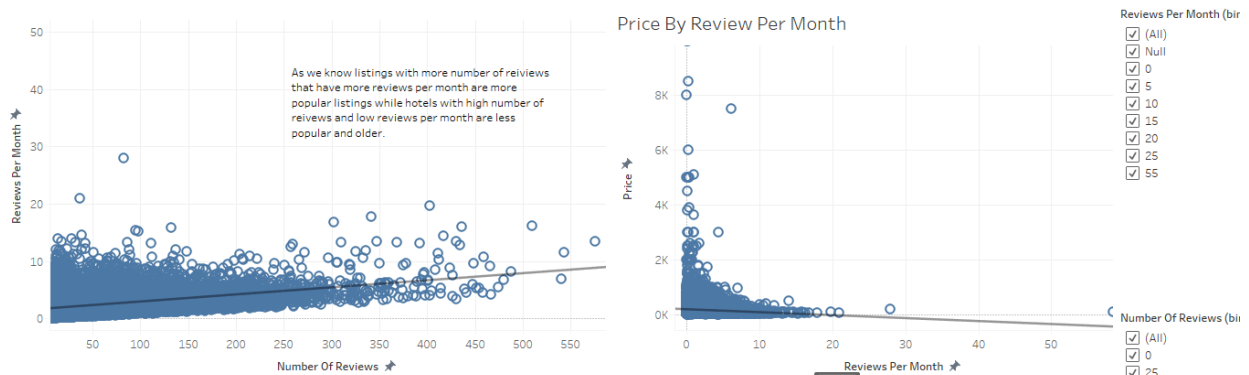

Count Of Each Price Range

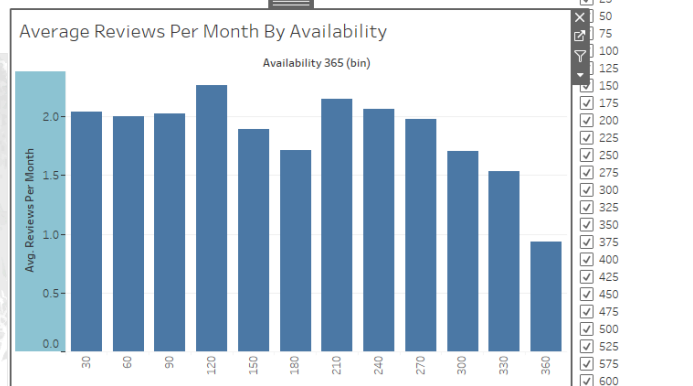

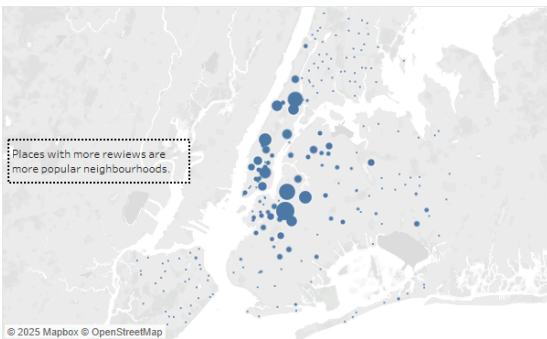

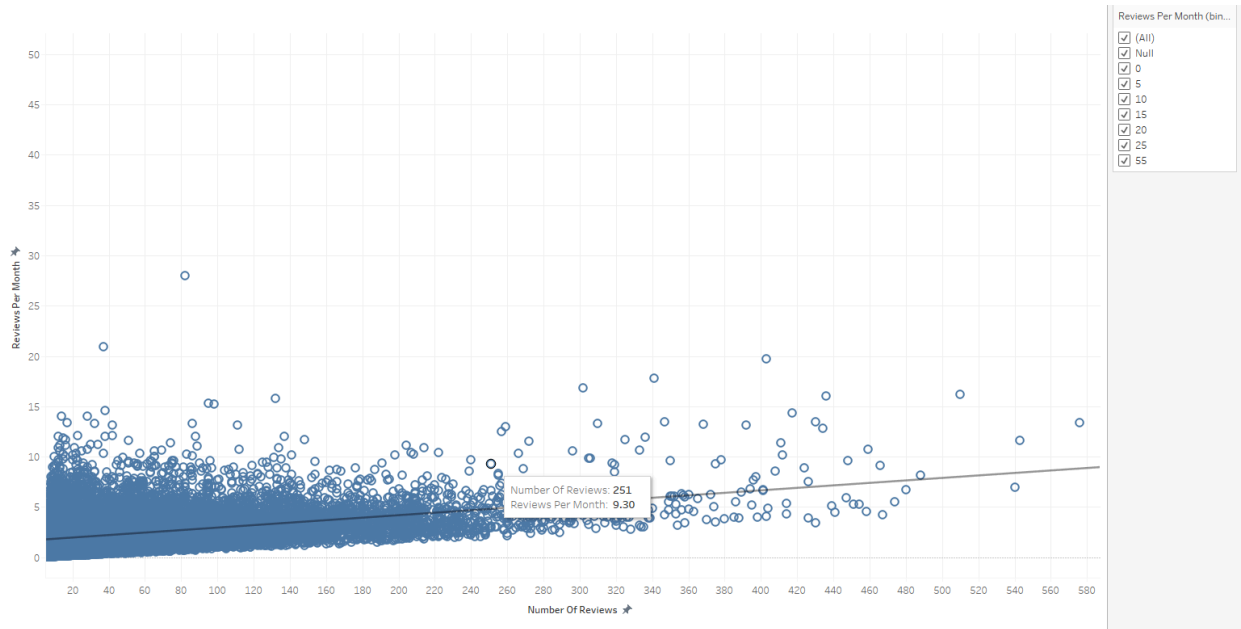

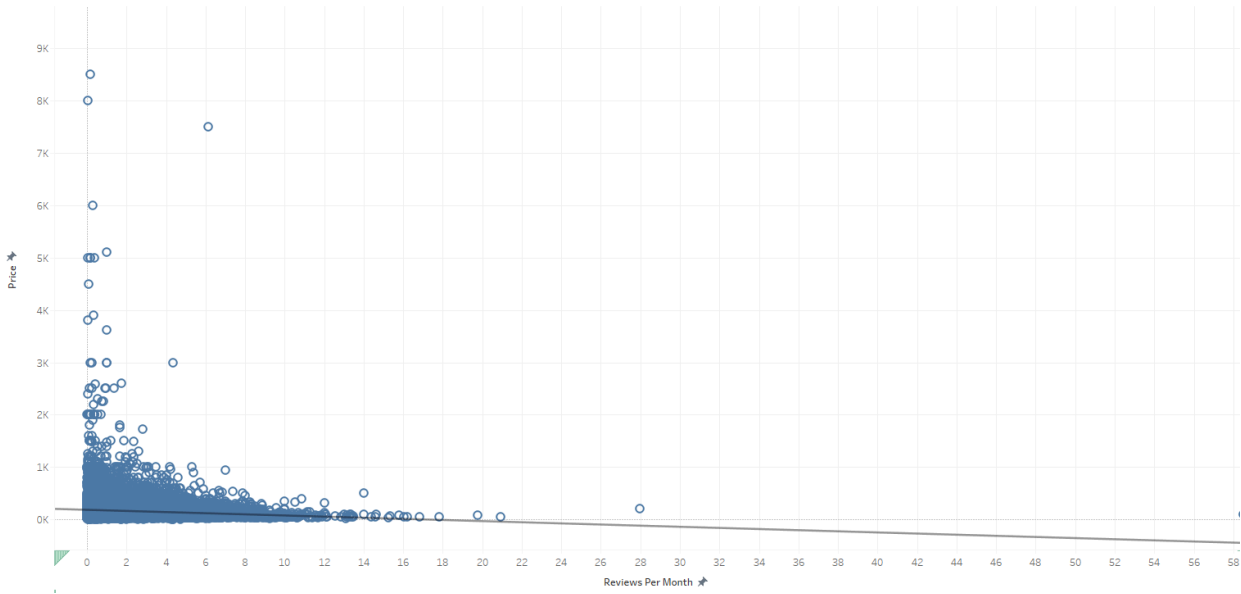

DashBoard 3:

Number Of Reviews Per Neighbourhood

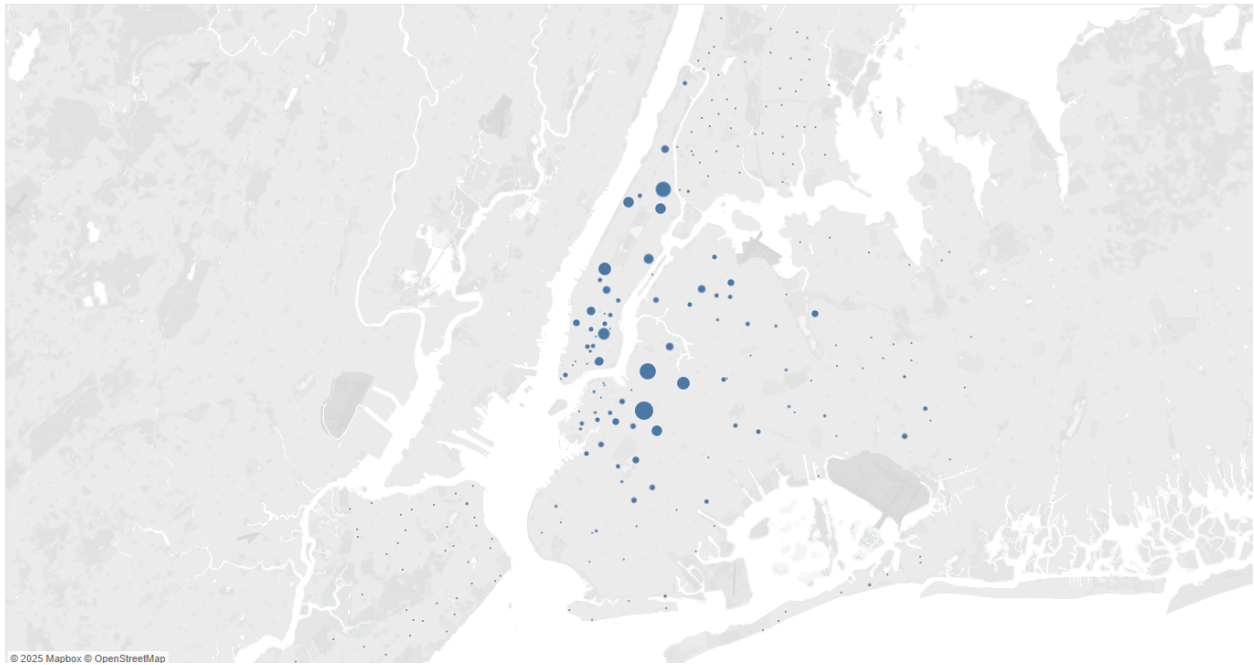

Price By Review Per Month

- Reviews Per Month (bin...)
- ☒ (All)
 - ☒ Null
 - ☒ 0
 - ☒ 5
 - ☒ 10
 - ☒ 15
 - ☒ 20
 - ☒ 25
 - ☒ 55

Number Of Reviews Per Neighbourhood

Parameters, Filters and KPIs:

We have two KPIs:

152.7
Average Price

1,138,005
Total count of Reviews

Filters:

In our dashboards there are filters about average price, number of reviews, price range, neighbourhood groups, reviews per month and number of reviews.

Narrative:

- 1) We See in the first dashboard as well as the third one that listings in the north of the city are the most popular listing.
- 2) We can see by the chart that there no correlation between price and availabilty, and in the reviews dashboard we can see that availability does not effet reviews per month that may suggest that some rooms are designed for certain seasons but still popular.
- 3) We can also see that "Entire Homes" has more average price in all of the neighbourhoods while "Shared Rooms" are cheaper.
- 4) We can also see that there is a more listing of lower priced rooms that may seguest there is higher demand for cheaper rooms. This also can be concluded from reviews price by reviews per month chart in reviews dashboard.

Overall we can observe that room type and neighbourhood are the most effective parameters on the price and reviews of the listings.
